Question 13.2.12:

1) Problem Statement

A die is tossed thrice. Find the probability of getting an odd number at least once.

Solution

Given:

We are given that the die is tossed thrice.

Need to find:

Probability of getting an odd number at least once in the three trials.

Solving steps:

Let X be a random variable defined as the number of odd number occurrences in three trials. Possible values of random variable X are;

$$X = \{0, 1, 2, 3\} \quad (1)$$

Required values of X are;

$$X = \{1, 2, 3\} \quad (2)$$

which correspond to at least one odd number. Probability of an observation being odd is;

$$p = \frac{3}{6} = \frac{1}{2} \quad (3)$$

We know that;

$$\Pr(X = i) = {}^n C_i \times p^i \times (1 - p)^{(n-i)} \quad (4)$$

$$\text{where } n = 3 \text{ and } i \in \{0, 1, 2, 3\} \quad (5)$$

On solving;

$$\Pr(X = 1) = {}^3 C_1 \times \left(\frac{1}{2}\right)^1 \times \left(\frac{1}{2}\right)^{(3-1)} \quad (6)$$

$$\Pr(X = 1) = \frac{3}{8} \quad (7)$$

$$\Pr(X = 2) = {}^3 C_2 \times \left(\frac{1}{2}\right)^2 \times \left(\frac{1}{2}\right)^{(3-2)} \quad (8)$$

$$\Pr(X = 2) = \frac{3}{8} \quad (9)$$

$$\Pr(X = 3) = {}^3 C_3 \times \left(\frac{1}{2}\right)^3 \times \left(\frac{1}{2}\right)^{(3-3)} \quad (10)$$

$$\Pr(X = 3) = \frac{1}{8} \quad (11)$$

Required probability of at least one odd observation is equivalent to sum of $\Pr(X = 1)$, $\Pr(X = 2)$ and $\Pr(X = 3)$. Therefore, probability of at least one odd observation is;

$$\therefore \Pr(\text{At least one odd}) = \frac{7}{8} = 0.875 \quad (12)$$

Conclusion

The probability of getting an odd number at least once is 0.875 as also calculated using the python code. [1]
