Assignment 1

AI1110: Probability and Random Variables
Indian Institute of Techonology Hyderabad

Gunethra Bommineni*

Question 13.2.12:

Problem Statement

A die is tossed thrice. Find the probability of getting an odd number at least once.

Solution

Let X be a random variable defined as the number of odd number occurrences in three trials. Probability of an observation being odd is;

$$p = \frac{1}{2} \tag{1}$$

$$n = 3 \tag{2}$$

Let $F_X(i)$ be the Cumulative distribution function(CDF) such that;

$$F_X(i) = \sum_0^i {}^nC_i \times p^i \times (1-p)^{(n-i)} \tag{3}$$

$$\tag{4}$$

Required probability is equivalent to;

$$\Pr(1 \leq X \leq 3) = F_X(3) - F_X(0) \tag{5}$$

$$= \frac{7}{8} \tag{6}$$
